#### • BACKGROUND:

- Several studies have confirmed that a significant subset of patients (pts) with HER2 [+] BC achieve pathological complete response (pCR) with a dual HER2 blockade without chemotherapy (1,2)
- Early metabolic evaluation using 18F-fluorodeoxyglucose (FDG) positron emission to mography/computed
- tomography (PET/CT) might help to recognize those pts with a higher likelihood of obtaining a pCR and an excellent outcome (3).
- It is mandatory to design a strategy-based study to de-escalate systemic therapy for HER2-positive pts using the neodajuvant setting.

## INCLUSION CRITERIA:

- Pts age ≥ 18 years.
- Operable breast cancer (cT1-3 and/or cN0-2 tumors)
- Centrally-confirmed HER2 [+] by ASCO/CAP
- Known estrogen receptor (ER) and progesterone receptor (PR) status locally determined.
- Tumor size: - Diameter larger ≥ 1.5 cm by magnetic resonance imaging (MRI) or ultrasound. - Maximum standardized uptake value (SU-Vmax) ≥1.5 x SUVmean liver + 2 SD in FDG
  - Multicentric/multifocal allowed if ≥2 HER2 [+] lesions with a diameter larger ≥ 1.5 cm
- Eastern Cooperative Oncology Group (ECOG) performance status of 0-1.
- Adequate bone marrow and organ function.

## X EXCLUSION CRITERIA:

by MRI or ultrasound.

- Bilateral breast cancer or cT4 and/or cN3 tumors.
- Evidence of metastatic disease by routine clinical assessment. Patients with subclinic metastases (M1) according with FDG PET/CT will be included into Cohort C.
- - Clinically significant cardiovascular disease. Other malignancy ≤ 5 years.
- Prohibited treatments: - Previous chemotherapy, anti-HER2, radiotherapy, or endocrine therapy for invasive breast
  - Currently receiving anti-coagulant therapy, chronic treatment with corticosteroids, or another immunosuppressive agent. - Receiving any investigational treatment within 28 days prior to randomization.
- Uncontrolled infection or current infection with HIV, hepatitis B virus, or hepatitis C virus.
- Severe and/or uncontrolled medical condition that contraindicate patient participation.

#### TRIAL DESIGN This is a randomized, multicenter, non-comparative phase II trial. BASAL: PET/CT Scan (Total Body) Breast / MRI / Biopsy Blood samples R 1:4 **COHORT A: COHORT B: COHORT C:** N = 284N ≤45 N = 71PH $(ET^x)^{\dagger}x2$ TCH-Px2 FDG PET/CT Scan FDG PET/CT Scan CYCLE 2 Tumor tissue samples **Blood samples** PET non Responders esponders TCH-Px4 TCH-Px6 PH (ET<sup>x</sup>) x6 Tumor tissue samples Blood samples urgery or no **AFTER** SURGERY CYCLE 6 or 8 pCR or pCR or pCR Non-pCR non-pCR non-pCR PH (ET<sup>x</sup>) x12 PH (ET<sup>x</sup>) x12 CYCLE 18 Up to 3-Years FOLLOW UP (from Surgery) H, Herceptin SC; P, Perjeta IV; C, Carboplatin; T, Docetaxel; ET<sup>x</sup>, endocrine therapy (letrozole – post-menopausal / tamoxifen – pre-menopausal), PH(ET<sup>x</sup>), trastuzumab

and pertuzumab + endocrine therapy; TCH-P, trastuzumab and pertuzumab + docetaxel and carboplatin.

<sup>†</sup> All ER+ patients will receive ET<sup>x</sup> concomitantly with PH (except on chemotherapy)

§ PET RESPONDERS - sensitive: RECIST responders with SUV reduction >=40%

#### • PRIMARY OBJECTIVES:

- 1<sup>st</sup> co-primary endpoint: the rate of pCR as defined by the absence of invasive disease in the breast and axilla (ypT0/isN0) at the time of surgery achieved with PH ± endocrine therapy in PET responders pts (cohort B/PET responders).
- 2<sup>nd</sup> co-primary endpoint: 3-year (3-y) invasive disease-free survival (iDFS) rate defined as time from the first date of no disease to invasive recurrence, new invasive disease, or death by any cause in cohort B.

#### • SAMPLE SIZE:

- Total accrual will be 400 pts, with 71, 170, 114, and 45 pts included in cohorts A, B (PET-responders), B (PET non-responders), and C, respectively.
- Considering a 10% and 25% of drop-out rates at the time of 1st and 2th co-primary analysis, the study will be positive if ≥41 pts achieved a pCR in cohort B/PET responders; or if we observe ≤14 events of 3-y iDFS in cohort B.

- Decisions will be based on one-sided, exact binomial test. With a 2.5% type I error rate (H0: pCR ≤20% and 3-y iDFS ≤89%) and 80% power (HA: pCR ≥30% and 3-y iDFS ≥95%).

### SECONDARY OBJECTIVES:

- Other definitions of pCR
- Rates of breast-conserving surgery
- Tumor response by MRI
- Optimal FDG PET cut-off for pCR and other
- FDG PET/CT quantification parameters beside SUVmax for pCR
- DFS
- Distant-DFS
- Overall survival
- Progression-free survival
- Health-related quality of life

- Translational sub-studies will analyze biomarkers that may be predictive of response to dual HER2 blockade with PH:
  - PAM50 intrinsic subtypes - mRNA HER2 expression
- Tumor-infiltrating lymphocytes
- ctDNA
- PIK3CA mutations
- p53 mutations
- Immune-related genes expression
- Other genes expression included in the 72 gene RNA-based CodeSet)
